Cycling injuries on streetcar or train tracks
causes & solutions

Methods
We compared personal, trip, and route infrastructure characteristics of 87 crashes directly involving streetcar or train tracks to 189 crashes in other circumstances in Toronto, Canada.

We complemented this with engineering information about the rail systems, interviews of personnel at seven bike shops about advice they provide to customers, and width measurements of tires on commonly sold bikes.

Results
32% of injured cyclists had crashes that directly involved tracks. The vast majority resulted from the bike tire being caught in the rail flangeway, often when cyclists made unplanned maneuvers to avoid a collision.

Track crashes were more common
- with left turns at intersections
- with hybrid, racing and city bikes
- among less experienced and less frequent bicyclists, and among women
- on major city streets with parked cars & no bike infrastructure

There were no track crashes in route sections where streetcars and trains had dedicated rights of way.

Commonly sold bikes typically had tire widths narrower than the smallest track flangeways.

Conclusions
Certain demographics were more likely to have track-involved crashes, suggesting that increased knowledge about how to avoid them might be helpful. However, such advice is long-standing and common in Toronto, yet the injury toll is very high, underscoring the need for other solutions.

Bike tires wider than streetcar or train flangeways might prevent them being caught.

Route infrastructure made a difference to the odds of track-involved injuries. Dedicated rail rights of way, cycle tracks (physically separated bike lanes), and protected intersections that direct two-stage left turns would have prevented most of the observed track-involved injuries. These population-based measures are likely to be more successful, since they don’t require individual actions or repeated reinforcement.

87 (32%) injured in a crash directly involving tracks
137 (50%) injured, but not on a street with tracks
52 (19%) injured on a street with tracks

3 times injury risk on streets with tracks

Here, focus on 276 injured in Toronto
BMC Public Health 2016;16:617

Toronto streetcar system – largest in North America
80 km of 2-way tracks
- 8 routes in mixed traffic
- 3 in dedicated rights of ways

15% – tires slipped on rails
85% – tires caught in rail flangeways

> 50% of commonly sold bikes had tires narrow enough to be caught in the narrowest flangeways – those in girder rails (below, used on curves)

Only 8% of commonly sold bikes had tires likely wide enough not to be caught in widest flangeways – those next to tee rails (below, used on straight sections)
